

Some Options for Analysis Tables

VISITS TABLE

date_of_visits	day_of_week	holiday	restaurant_id	restaurant_genre	restaurant_area_name	restaurant_long	restaurant_lat	#visits_asrecordedbyAir
----------------	-------------	---------	---------------	------------------	----------------------	-----------------	----------------	-------------------------

Note: this table alone is sufficient to allow for prediction attempts

RESERVATIONS TABLE

datetime_reserved	day_of_week	holiday	restaurant_id	restaurant_genre	restaurant_area_name	restaurant_long	restaurant_lat	date_reservation_entered	#seats_reserved
-------------------	-------------	---------	---------------	------------------	----------------------	-----------------	----------------	--------------------------	-----------------

Note: In order to create this table, need to decide if/how Air and hpg data should be merged - or could drop one source!

RESERVATIONS-VISITS TABLE

date_of_visits	day_of_week	holiday	restaurant_id	restaurant_genre	restaurant_area_name	restaurant_long	restaurant_lat	combined_visits_reservations_estimate
----------------	-------------	---------	---------------	------------------	----------------------	-----------------	----------------	---------------------------------------

Note: In order to create this table, need to decide how reservation data can be merged with visit data - or should some combined more abstract metric be created?
